Decode the chart

Chart 1 - Regional comparison - Q4 2026

It compares student enrollment in four cities. Bengaluru has the highest enrollment and Bopal the lowest. I mostly trust it because a bar chart is suitable for comparing numbers.

Chart 2 - Budget Allocation by department (9 categories)

It shows how a budget is divided among 9 departments / categories. I do not fully trust it because the categories and exact amount are not clearly labelled.

Chart - 3: chocolate consumption vs Nobel Prizes won

It shows that chocolate consumption and Nobel Prizes increases together. I do not trust it as proof of a real connection.

Because two things increasing together
does not mean one causes the other

chart 4 - Height (cm) vs weight (kg)

It shows the relationship between
height and weight. The point are
widely scattered, so there is no
very clear relationship. I would
be careful trusting it, because the
data has many scattered points.
and the source / sample is not given
